Question What distinguishes the physiology of prokaryotes from eukaryotes? Prokaryotes lack membrane-bound organelles, have simpler cellular structures, and often exhibit unique metabolic pathways, allowing them to thrive in diverse environments. Their physiology includes characteristics like rapid growth, diverse cell wall structures, and specialized mechanisms for nutrient uptake and energy production. How do the biochemistry of prokaryotic cell walls differ from eukaryotic cells? Prokaryotic cell walls primarily contain peptidoglycan (in bacteria), providing structural strength and shape. In contrast, eukaryotic cells lack peptidoglycan and have other structural components like cellulose or chitin. The composition influences how prokaryotes interact with their environment and respond to antibiotics. What are the key metabolic pathways active in prokaryotes? Prokaryotes utilize diverse metabolic pathways such as glycolysis, the tricarboxylic acid cycle, fermentation, and various anaerobic respiration processes. These pathways enable them to utilize a wide range of substrates for energy, often adapting to extreme or nutrient-poor environments. How does the biochemistry of prokaryotic membranes facilitate their survival in harsh conditions? Prokaryotic membranes contain unique lipids, such as hopanoids, that stabilize membrane integrity under extreme conditions like high temperature, acidity, or salinity. These adaptations help maintain fluidity and functionality of membrane-bound enzymes and transport systems. What role do enzymes play in prokaryotic physiology? Enzymes catalyze essential biochemical reactions in prokaryotes, including energy production, biosynthesis, and nutrient assimilation. They enable rapid responses to environmental changes and are often specialized for functions like nitrogen fixation or degradation of pollutants. How do prokaryotes regulate their internal biochemistry in response to environmental stress? Prokaryotes employ mechanisms such as the production of stress proteins, alterations in membrane fatty acid composition, and changes in metabolic activity.
