Understanding GPS and GSM Technologies

What is GPS?

The Global Positioning System (GPS) is a satellite-based navigation system that enables precise location tracking anywhere on Earth. It operates through a constellation of satellites orbiting the planet, which transmit signals to GPS receivers installed in vehicles or assets. The receiver calculates its position by analyzing signals from multiple satellites.

What is GSM?

The Global System for Mobile Communications (GSM) is a standard for mobile networks that facilitates data transmission over cellular networks. It allows devices to send and receive data through SIM cards, enabling communication between the vehicle tracking device and remote servers or user interfaces.

How Do GPS and GSM Work Together?

While GPS provides accurate location data, GSM transmits this data to a centralized server or user interface. The integration of both allows real-time tracking, status updates, and alerts to be delivered via mobile networks, making vehicle tracking systems highly effective and accessible.
