Multi-Part Questions

- Often present a scenario followed by multiple related questions that build upon each other.
- Encourage students to demonstrate comprehensive understanding.

Common Traps and Misconceptions

- Questions are designed to challenge misconceptions, such as confusing work and energy, or misapplying Newton's laws in non-inertial frames.

- Careful reading and conceptual clarity are essential for correct responses.

Sample Question Types and Strategies

Below are illustrative examples of question types and strategic approaches:

Multiple Choice Example

> A block slides down an inclined plane with friction. Which of the following best describes the work done by friction?

- > - A) Zero
- > - B) Positive and increases as the block slides
- > - C) Negative and decreases as the block slides
- > - D) Negative and remains constant
- > - E) Positive and remains constant

Strategy: Recognize that friction opposes motion, so the work done by friction is negative when the object slides down. The correct answer is C.

Free Response Example

> A mass oscillates on a spring attached to a frictionless surface. Derive an expression for the period of oscillation and explain how the period changes if the mass is doubled.

Approach: Students should recall the formula $T = 2\pi \sqrt{\frac{m}{k}}$, derive it if necessary, and explain that doubling the mass increases the period by a factor of $\sqrt{2}$.
