What is Machine Learning?

Definition and Core Concepts

Machine learning (ML) is a subset of artificial intelligence (AI) that involves developing algorithms that enable computers to learn from and make decisions based on data. Unlike traditional programming, where rules are explicitly coded, ML models identify patterns in data to make predictions or classifications.

Core concepts in machine learning include:

- **Data:** The foundational element used for training models.
- **Features:** Individual measurable properties or characteristics of the data.
- **Labels:** The output or target variable that the model aims to predict.
- **Model:** The mathematical representation that maps features to labels.
- **Training:** The process of fitting a model to data.
- **Evaluation:** Assessing the model's performance on unseen data.

Types of Machine Learning

Machine learning can be broadly categorized into three types:

- **Supervised Learning:** Models are trained on labeled data. Examples include classification (e.g., spam detection) and regression (e.g., predicting house prices).

- **Unsupervised Learning:** Models find patterns in unlabeled data. Examples include clustering (e.g., customer segmentation) and dimensionality reduction.
- **Reinforcement Learning:** Models learn to make decisions by receiving feedback in the form of rewards or penalties, often used in game playing and robotics.
