Question 1: Airway Management in Trauma

Q: A 35-year-old male is brought to the emergency department after a car accident. He is conscious but has noisy breathing and stridor. What is the most appropriate initial airway management step?

A: Evaluate airway patency, consider cervical spine stabilization, and prepare for definitive airway management if necessary.

Correct Answer: Secure the airway promptly, with cervical spine precautions.

Explanation: In trauma patients with airway compromise signs such as stridor, prompt airway assessment and securing are critical. If airway patency is compromised, endotracheal intubation or surgical airway may be necessary. Always stabilize the cervical spine during airway management in trauma patients.

Question 2: Shock Classification

A: Hypovolemic shock due to blood loss.

Correct Answer: Hypovolemic shock.

Explanation: The low blood pressure combined with tachycardia and pallor suggests hypovolemic shock, often caused by hemorrhage. Recognizing the type of shock guides appropriate resuscitation strategies.

Question 3: Imaging in Trauma

Q: Which imaging modality is most appropriate for evaluating suspected pneumothorax in a trauma patient?

A: Chest X-ray.

Correct Answer: Perform a bedside chest X-ray to evaluate for pneumothorax.
