Sockets API

The sockets API is the core interface used to build network applications. It involves creating socket descriptors, binding to addresses, listening for connections, and sending/receiving data.

Key functions include:

- `socket()`: Creates a new socket

- TCP: Reliable, connection-oriented protocol suitable for applications requiring data integrity.
- UDP: Connectionless, lightweight protocol suitable for real-time applications like streaming.

Network Byte Order and Data Representation

Because different systems have different byte orders (endianness), Stevens emphasizes the importance of converting data to network byte order using functions like `htonl()`, `htons()`, `ntohl()`, and `ntohs()` to ensure compatibility across diverse systems.

Practical Applications of Stevens' Techniques

Richard Stevens' methodologies extend to practical implementation strategies:

Designing Robust Network Servers

- Use of `fork()` or threads to handle multiple clients simultaneously
